Documentation Technique

Sommaire

 Procédure d'installation du projet et de ses dépendances

Documentation Technique

Installer le projet en local avec Git et Composer en ligne de commande

1) Aller dans à la racine du projet et lancer la commande composer update

```
C:\Users\passpass>cd C:\xampp\htdocs\FreelancerSIO  
  
C:\xampp\htdocs\FreelancerSIO>composer update  
Loading composer repositories with package information  
Updating dependencies (including require-dev)  
  
Installing twig/twig (v1.26.1)  
Loading from cache
```

2) Envoyer la même commande
depuis le dossier admin

```
C:\xampp\htdocs\FreelancerSIO>cd admin  
  
C:\xampp\htdocs\FreelancerSIO\admin>composer update  
Loading composer repositories with package information  
Updating dependencies (including require-dev)  
-
```

Documentation Technique

Créer les tables et les entités du FOSUserBundle

```
C:\xampp\htdocs\freelancerppe> php bin/console doctrine:generate:entities AppBundle\Entity\User
Generating entity "AppBundle\Entity\User"
> backing up User.php to User.php~
> generating AppBundle\Entity\User

C:\xampp\htdocs\freelancerppe> php bin/console doctrine:schema:update --force
Updating database schema...
Database schema updated successfully! "1" query was executed
```

The screenshot shows a database management interface with a tree view on the left and a query editor on the right. The tree view shows the 'ppe_freelancer' database with various tables and views. The 'fos_user' table is selected, showing its columns: id, username, username_canonical, email, email_canonical, enabled, salt, password, last_login, locked, expired, expires_at, confirmation_token, password_requested_at, roles, credentials_expired, and credentials_expire_at. The query editor shows the query 'SELECT * FROM fos_user;' and the result set is empty.

The screenshot displays a Symfony 2 project in an IDE. The left sidebar shows the project structure with the following folders and files:

- composer.lock
- freelancer.acces.png
- index.php
- readme.md
- routes.php
- app
 - Resources
 - FOSUserBundle
 - translations
 - views
 - default
 - freelance
 - AddPerson.html.twig
 - LICENSE.txt
 - README.txt
 - index.html
 - index.html.twig
 - left-sidebar.html
 - no-sidebar.html
 - right-sidebar.html
 - base.html.twig
 - login.html.twig
- config
 - config.yml
 - config_dev.yml
 - config_prod.yml
 - config_test.yml
 - parameters.yml
 - parameters.yml.dist
 - routing.yml
 - routing_dev.yml
 - security.yml
 - services.yml
- .htaccess
- AppCache.php
- AppKernel.php
- autoload.php
- bin
- front
- src
 - AppBundle
 - Controller
 - FreelanceController
 - SocieteController
 - DefaultController.php

The main editor shows the `index.html.twig` file, which extends the `base.html.twig` template. It contains a `dump(test)` call and a `section` block for the banner. The `DefaultController.php` file is also visible, showing the `indexAction` and `testAction` methods. The `indexAction` method sets a `$test` variable to an array and renders the `freelance/index.html.twig` template. The `testAction` method renders the `default/index.html.twig` template with a `$name` parameter.

Run Symfony Command (freelancerppe)

Filter: doctrine
(part of command name, wildcards: "?", "*")

Parameters:

Matching Tasks:

doctrine:mapping:convert : Convert mapping information between supported formats.

doctrine:mapping:import : Imports mapping information from an existing database

doctrine:mapping:info :

doctrine:query:dql : Executes arbitrary DQL directly from the command line.

doctrine:query:sql : Executes arbitrary SQL directly from the command line.

doctrine:schema:create : Executes (or dumps) the SQL needed to generate the database schema

doctrine:schema:drop : Executes (or dumps) the SQL needed to drop the current database schema

doctrine:schema:update : Executes (or dumps) the SQL needed to update the database schema to match the current mapping metadata.

doctrine:schema:validate : Validate the mapping files.

Usage:

doctrine:schema:drop [--dump-sql] [--force] [--full-database] [--em [EM]]

Processes the schema and either drop the database schema of EntityManager Storage Connection or generate the SQL output.
Beware that the complete database is dropped by this command, even tables that are not relevant to your metadata model.

Hint: If you have a database with tables that should not be managed
by the ORM, you can use a DBAL functionality to filter the tables and sequences down
on a global level:

\$config->setFilterSchemaAssetsExpression(\$regexp);

Command: console doctrine:schema:drop

Keep this dialog opened

Composer (freelancerppe)

Arborescence du Bundle

The screenshot displays an IDE environment with three main components:

- Composer JSON File:** The central editor shows the `composer.json` file for a project named `sonata-project`. It lists various Symfony bundles and their versions, including `friendsofsymfony/user-bundle`, `symfony/form`, `symfony/validator`, `symfony/config`, `symfony/translation`, `symfony/security-csrf`, `symfony/twig-bridge`, `twig/twig`, `symfony/console`, `symfony/asset`, and `egeloen/ckeditor-bundle`. It also defines a `require-dev` section with `sensio/generator-bundle`, `symfony/phpunit-bridge`, and `sonata-project/intl-bundle`.
- Output - Composer (freelancerppe):** The bottom panel shows the execution output of the `composer install` command. It includes messages about clearing the cache for the `dev` environment, installing assets as relative symbolic links, and a table of installed bundles and their methods.
- Composer Packages (freelancerppe):** A side window provides detailed information about the `sonata-project/intl-bundle` package, including its description, keywords, versions, type, license, source, and distribution format.

Output - Composer (freelancerppe) Details:

```
> Sensio\Bundle\DistributionBundle\Composer\ScriptHandler::buildBootstrap
Updating the "app/config/parameters.yml" file
> Sensio\Bundle\DistributionBundle\Composer\ScriptHandler::clearCache
> Sensio\Bundle\DistributionBundle\Composer\ScriptHandler::installAssets

// Clearing the cache for the dev environment with debug true

[OK] Cache for the "dev" environment (debug=true) was successfully cleared

Trying to install assets as relative symbolic links.

> Sensio\Bundle\DistributionBundle\Composer\ScriptHandler::installRequirementsFile
> Sensio\Bundle\DistributionBundle\Composer\ScriptHandler::prepareDeploymentTarget
```

	Bundle	Method / Error
WARNING	FrameworkBundle	copy
WARNING	IvoryCKEditorBundle	copy

```
! [NOTE] Some assets were installed via copy. If you make changes to these assets you have to run this command again.

[OK] All assets were successfully installed.

Done.
```
